CONNECTOR

SHAREPOINT & OFFICE 365

Revised Jul.
2021

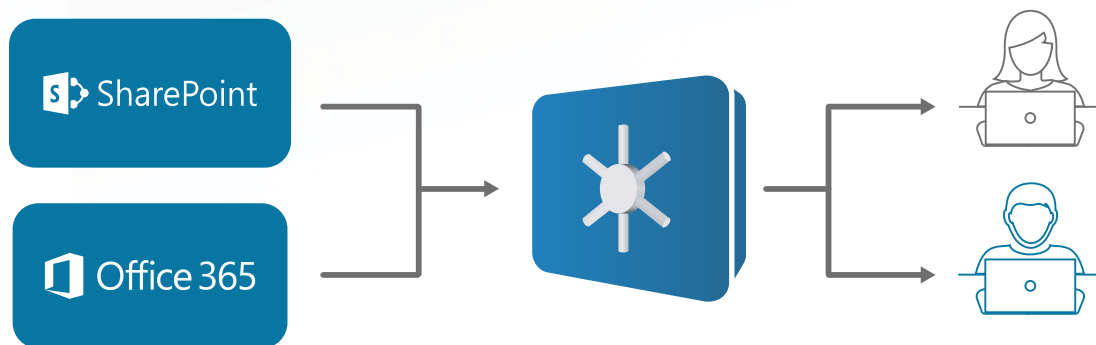

Sync Your SharePoint and Office365
Content into ShareVault

SHAREVAULT CONNECTOR FOR SHAREPOINT & OFFICE 365

Sync Your SharePoint and Office365 Content into ShareVault

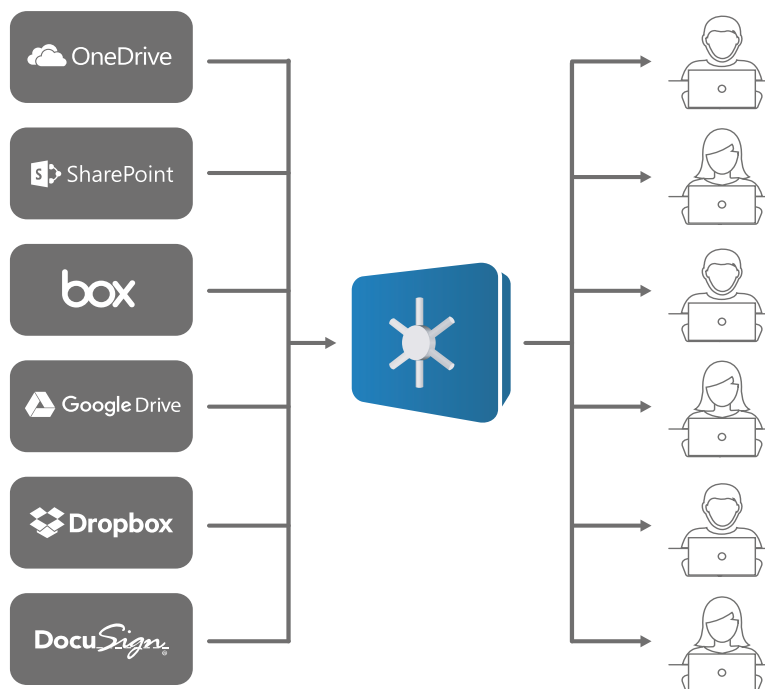

The ShareVault Connector for Microsoft SharePoint and Office365 allows you to seamlessly sync files from specified sites, document libraries and folders into ShareVault so you can securely share documents with external parties. ShareVault is the ONLY virtual data room provider offering a connector for SharePoint and Office365.

If you believe that your current solution already provides the capabilities needed for external sharing of confidential documents, you'll want to contact your ShareVault account executive to review your requirements and to see how ShareVault can improve your process.

SINGLE PANE OF GLASS FOR ALL YOUR SENSITIVE CONTENT

ShareVault Connectors provide tight integration with **Box, Dropbox, SharePoint, Office365 and/or DocuSign**. You can add several connectors to assemble content from various organizations on a single “pane of glass,” so that outside users can access a single web application to view documents from multiple platforms.

SEAMLESS INTEGRATION

Combine the flexibility of SharePoint and Office365 with ShareVault’s enterprise-grade document security and document organization tools. Choose the sites, document libraries and folders that should be synced to ShareVault for external sharing, and the powerful one-way sync engine will take care of keeping the contents current with your source folders. The hierarchical structure within ShareVault mirrors the structure of the synced sites, document libraries and folders in SharePoint / Office365.

WHY NOT JUST USE SHAREPOINT OR OFFICE365 FOR EXTERNAL SHARING OF CONFIDENTIAL DOCUMENTS?

SharePoint and Office365 allow for efficient, multi-party content collaboration. The powerful capabilities allow customers to develop best practices for collaborative content development among internal users contributing to the authoring process.

However, when confidential documents need to be shared with external parties, SharePoint's ability to organize, protect, selectively share and track these documents is limited. SharePoint access by outside parties can also be technically challenging due to firewalls or complexities of VPN and FTP.

However, for business applications involving external sharing of confidential documents, such as due diligence, the best practice is to use a full featured virtual data room to share confidential documents with third parties securely.

FEATURES

Beyond having the broadest enterprise integration options, ShareVault also offers unique features which provide superior document level protection, and streamline the uploading and organization of your files and setting of security policies. facilitate the review process:
